
Human Mechatronics™ - Welcome

When I set out to create Human Mechatronics™, I was intent on creating a science that would be more than just “telling one what to do.” I have been told countless times over my life, and have heard others being told, that, “You must focus more.” Focus! Even today, I am starting to see “Focus” in so many posts on social media. From day one, that I can remember, when I was told I have to focus more, I asked myself, “What does that mean, and how do I do it?” Is it just a matter of waving my hands and saying it to myself? Do I squint my eyes so they are more intense? Do I hold the sides of my head with my fingers and push inwards trying to steer my concentration? Nobody ever answered those questions.

Later on in life, after decades of life-experiences and living thorough depression, I found the strength somehow, to look back and connect all the dots in my life. It hurt like hell at first. I sank into a deep hole. Eventually, with help, I felt stronger and more focused; as if I had become a rock start in my own mind. I connected those dots to make sense of my depression. That wasn't enough however, I needed to create a drive forward for my future life. I still loved life even though God had heard some words that may have never before been said. I took my experiences as a Driving Instructor/Supervisor who transitioned into a very successful Construction/Contracting Project Manager with an excellent company, where I became, and still am, their Sales & Marketing Manager. That is when I started to form the beginning to this science.

It started back in 2014 with, WYLIWYG: Where You Look Is Where You Go®. The photo above shows the very first day I went public with that term. It was to a sold out event coordinated and carried out with my friend and mentor, Doug Dane of the Proctor-Gallagher Institute. After the event his words to me were, “You have to do something with that, man!” The very next day I registered and eventually received the registered trademark for that very phrase.

Everything grew out of that event to what you see on my new website, www.HumanMechatronics.com. My hope is that you allow some time to see what's here and find something that will resonate with you and prove to be useful in your pursuit of a life the way you want to live it. Keep checking in here as it will only grow and offer more way to expand your mind. As I say at the end of my first book, “Let ‘er Rip!”
